

# The Impact on Algebra vs. Geometry of a Learners Ability to Develop Reasoning Skills

In this masters thesis, Dr. Lisa A. Johnson Q.M.E. examines the impact of three reasoning skills: number sense, structure sense, and abstract reasoning on algebra and geometry. The study concentrates its efforts on data compiled from more than twenty researchers in this area, an extensive annotated bibliography, and work done at ficticiously named Union High School, real school classes consisting of 48 math students and eight math teachers. Through the efforts of this study, Dr. Johnson determined that algebra relies on abstract reasoning and structure sense, while geometry does not. Moreover, Dr. Johnson observed that further instruction needs to be given to teachers on communicating the three reasoning skills, as the teachers studied were not sufficiently knowledgeable in these areas. With teacher improvements, students in non-sufficient school systems could better excel in mathematics. About the Author Dr. Johnson holds two bachelors in sciences; three masters degrees, one of which is in Math Education Curriculum, and a doctorate degree. She attributes her success to her parents and sisters. This is her second publication.
